

SMART CONTRACT CODE REVIEW AND SECURITY ANALYSIS REPORT

Customer: BRing Finance

Date: December 10th, 2021

This document may contain confidential information about IT systems and the intellectual property of the Customer as well as information about potential vulnerabilities and methods of their exploitation.

The report containing confidential information can be used internally by the Customer, or it can be disclosed publicly after all vulnerabilities are fixed — upon a decision of the Customer.

Document

Name	Smart Contract Code Review and Security Analysis Report for BRing Finance.		
Approved by	Andrew Matiukhin CTO Hacken OU		
Туре	ERC20 token; Staking		
Platform	Ethereum / Solidity		
Methods	Architecture Review, Functional Testing, Computer-Aided Verification, Manual Review		
Repository	https://github.com/ElephantsLab/bRing-contracts-v2		
Commit	99097983924a3ed2ed77e15222c8153c77ef3199		
Deployed	https://testnet.bscscan.com/address/0x6462106cc4a3de77d9ceb83b9983		
contract	<u>1e63300132f3</u>		
Technical	YES		
Documentation			
JS tests	YES		
Website	bring.finance		
Timeline	01 DECEMBER 2021 - 10 DECEMBER 2021		
Changelog	06 DECEMBER 2021 - INITIAL AUDIT		
	10 DECEMBER 2021 - Second Review

Introduction	
Scope	4
Executive Summary	5
Severity Definitions	8
Audit overview	9
Conclusion	11
Disclaimers	12

Introduction

Hacken OÜ (Consultant) was contracted by BRing Finance (Customer) to conduct a Smart Contract Code Review and Security Analysis. This report presents the findings of the security assessment of the Customer's smart contract and its code review conducted between December 1st, 2021 - December 6th, 2021.

Second review conducted on December 10th, 2021.

Scope

The scope of the project is smart contracts in the repository:

Repository:

https://github.com/ElephantsLab/bRing-contracts-v2

Commit:

99097983924a3ed2ed77e15222c8153c77ef3199

Deployed contract:

 $\underline{https://testnet.bscscan.com/address/0x6462106cc4a3de77d9ceb83b99831e63300132f3}$

Technical Documentation: Yes, https://docs.google.com/document/d/1Ywav-

c1MZfdQXVc1dVFFpg9JYIW3EPq9uL06n-iuyos/

JS tests: Yes, https://github.com/ElephantsLab/bRing-contracts-v2/tree/tests

Contracts:

bRingFarming.sol

bRingFarmingOwnable.sol

bRingToken.sol

We have scanned this smart contract for commonly known and more specific vulnerabilities. Here are some of the commonly known vulnerabilities that are considered:

Category	Check Item
Code review	Reentrancy
	Ownership Takeover
	 Timestamp Dependence
	Gas Limit and Loops
	DoS with (Unexpected) Throw
	DoS with Block Gas Limit
	 Transaction-Ordering Dependence
	Style guide violation
	Costly Loop
	ERC20 API violation
	Unchecked external call
	Unchecked math
	Unsafe type inference
	Implicit visibility level
	Deployment Consistency
	Repository Consistency

	■ Data Consistency
Functional review	Business Logics Review
	Functionality Checks
	Access Control & Authorization
	Escrow manipulation
	Token Supply manipulation
	Assets integrity
	User Balances manipulation
	 Data Consistency manipulation
	 Kill-Switch Mechanism
	Operation Trails & Event Generation

Executive Summary

According to the assessment, the Customer's smart contracts are well-secured.

Insecure	Poor secured	Secured	Well-secured
		You are	here

Our team performed an analysis of code functionality, manual audit, and automated checks with Mythril and Slither. All issues found during automated analysis were manually reviewed, and important vulnerabilities are presented in the Audit overview section. All found issues can be found in the Audit overview section.

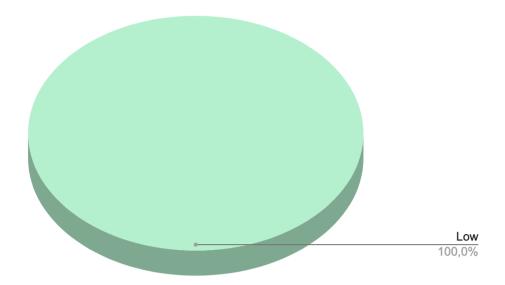

As a result of the audit, security engineers found 1 medium and 4 low severity issues.

As a result of the second review, security engineers found ${\bf 1}$ low severity issue.

Graph 1. The distribution of vulnerabilities after the audit.

Severity Definitions

Risk Level	Description		
Critical	Critical vulnerabilities are usually straightforward to exploit and can lead to assets loss or data manipulations.		
High	High-level vulnerabilities are difficult to exploit; however, they also have a significant impact on smart contract execution, e.g., public access to crucial functions		
Medium	Medium-level vulnerabilities are important to fix; however, they can't lead to assets loss or data manipulations.		
Low	Low-level vulnerabilities are mostly related to outdated, unused, etc. code snippets that can't have a significant impact on execution		

Audit overview

■ ■ ■ Critical

No critical issues were found.

High

No high severity issues were found.

■ ■ Medium

No tests were provided.

Contracts: bRingFarmingOwnable.sol, bRingFarming.sol

It's recommended to cover all non-trivial contracts with tests.

The recommended coverage is minimum 95% for branches, while it should be definitely 100% for the main logic contracts.

Status: fixed

Low

1. Missing input value validation

Contracts: bRingFarmingOwnable.sol

Functions: configPool

Documentation and other methods imply that <code>farmingSequence[]</code> size is 10 or less, but there is no validation.

Recommendation: Add validation

Status: fixed

2. View function iterates over an array of unpredictable size

Contracts: bRingFarming.sol

Functions: viewStakingDetails

Size of stakes[userAddress][] is constantly growing when the user

stakes and at some moment function could become inoperable.

Recommendation: Add *limit* and *offset* parameter to view function

Status: fixed

3. Missing event for changing pools, referralPercents, stakingDuration

Contracts: bRingFarmingOwnable.sol

Functions: configPool, changeReferralPercents, changeStakingDuration

Changing critical values should be followed by the event emitting for better tracking off-chain.

Recommendation: Please emit events on the critical values changing. These events are not for the contract owner but for the community to track changes off-chain.

4. A public function that could be declared external.

public functions that are never called by the contract should be declared external to save gas.

Contracts: bRingToken.sol, bRingFarming.sol

Functions: batchTransfer, getReferrals, getReferralsNumber

Recommendation: Use the external attribute for functions never called

from the contract.

Status: fixed

Conclusion

Smart contracts within the scope were manually reviewed and analyzed with static analysis tools.

The audit report contains all found security vulnerabilities and other issues in the reviewed code.

As a result of the audit, security engineers found 1 medium and 4 low severity issues.

As a result of the second review, security engineers found 1 low severity issue.

Disclaimers

Hacken Disclaimer

The smart contracts given for audit have been analyzed in accordance with the best industry practices at the date of this report, in relation to cybersecurity vulnerabilities and issues in smart contract source code, the details of which are disclosed in this report (Source Code); the Source Code compilation, deployment, and functionality (performing the intended functions).

The audit makes no statements or warranties on the security of the code. It also cannot be considered as a sufficient assessment regarding the utility and safety of the code, bug-free status, or any other statements of the contract. While we have done our best in conducting the analysis and producing this report, it is important to note that you should not rely on this report only — we recommend proceeding with several independent audits and a public bug bounty program to ensure the security of smart contracts.

Technical Disclaimer

Smart contracts are deployed and executed on a blockchain platform. The platform, its programming language, and other software related to the smart contract can have vulnerabilities that can lead to hacks. Thus, the audit can't guarantee the explicit security of the audited smart contracts.
